In 2016 the Global Forum for Rural Advisory Services (GFRAS) developed the New Extensionist Learning Kit (NELK) modules on functional skills for individual extension staff, in response to the demand from its network. GFRAS continues to develop new set of modules covering different technical skills. The Learning Kit contains modules designed for self-directed, face-to-face, or blended learning and can be a useful resource for individual extension field staff, managers, and lecturers.

Responding to the growing demand from extension and rural advisory service providers worldwide to adapt the modules to the local contexts, GFRAS has embarked on the journey to support the NELK Customization process. NELK Customization is understood as a guided process as permitted by GFRAS aimed as adapting the original module to suit the local context. Details on this process can be found on the NELK Customization Guide.

This Community Mobilisation and Farmer Needs Assessment Module is development as part of the NELK Customized package adapted from Module 8: Community Mobilisation.

Original Module

Lead author: John Recha

Editor: Elmarie Kruger

Layout: Deborah Els

Financial support:

This module was made possible through the support of the Swiss Development Confederation (SDC). The contents of this module are the responsibility of the authors and do not necessarily reflect the views of Swiss Government.

Customized Module

Lead authors: Moussa Senge Kyembwa and Agnes Mukayiranga

Editor: Heather McLachlan

Layout: Deborah Els

Advisory group: Jean Claude Izamuhaye, Gafarasi Isadore and Charles Murekezi

Financial support:

This customized module is made possible by the generous support of the American people through the United States Agency for International Development (USAID). The contents are the responsibility of the authors and do not necessarily reflect the views of USAID or the United States Government.

The customization process was in collaboration between the Feed the Future Developing Local Extension Capacity project, implemented by Feed the Future Rwanda Hinga Weze Activity, which co-funded the customization of this module.

Community mobilization and farmer needs assessment 1

Study unit 1: Culture and diversity including gender, youth and people with disabilities 4

Study unit overview
Study unit introduction

Session 1.1: Understanding culture and diversity 5

Introduction

Session 1.2: Vision for inclusive local community 9

Introduction
Diversity in a community 10
Relationships between cultural groups 10
Building alliances and coalitions within cultural groups 11

Session 1.3: Building a diverse and inclusive community 12

Introduction 12

Session 1.4: Enhancing women and youth participation in productivity 15

Introduction 15

Study unit 2: Livelihood assets assessment 18

Study unit overview 18
Study unit introduction 19

Session 2.1: Gathering information 20

Introduction 20

Assessment types 21
Information needed for a livelihoods assets assessment 22

Session 2.2: Sampling and assessment planning 25
Introduction 25
Steps to planning an assessment 25

Session 2.3: Core components of livelihood assets assessments 32

Session 2.4: Analyzing results 37

Study unit 3: Problem solving approaches 42
Study unit overview 42
Introduction 42
Session 3.1: Defining problems and their root causes

Defining the problem

Determining the root causes of a problem

Session 3.2: Participatory development of a basket of options

Introduction

Generate potential solutions

Relate solutions to root causes

Session 3.3: Participatory selection of an appropriate solution

Introduction

Determining solution feasibility

Evaluating solution acceptability

Session 3.4: Participatory implementation

Introduction

Importance of participatory implementation

Steps to consider for implementation

Session 3.5: Participatory monitoring and evaluation

Introduction

Data collection

Progress reports
Study unit 4: Leadership development 54

Session 4.1: Leadership styles 55

Session 4.2: Communication skills 58

Session 4.3: Leading and motivating community co-workers 61

Session 4.4: Mentoring 63
Session 4.5: Time management

Introduction

Characteristics of effective time management

Benefits of effective time management

Time management strategies

Session 4.6: Participatory goal setting and accountability

Introduction

Benefits of setting goals

Characteristics of effective goals

Developing an action plan

Importance of accountability in leadership

Session 4.7: Teamwork

Introduction

Types of teams

Stages of team development

Team-building strategies

Concluding remarks

Study unit 5: Farmer needs assessment

Introduction
Session 5.1: Organization 79

Session 5.2: Exploration 81

Session 5.3: Assessment 82

Session 5.4: Utilization 87
1. Before you begin

1.1 General instruction

This module should be used in conjunction with the workbook provided. As you read through the module, you will find different visual features that are designed to help you navigate the document.

Figure 1: Icons used to highlight important information throughout the manual

The module makes use of keywords (difficult or technical words that are important for you to understand). To ensure that you receive the full benefit from the module, keywords will be marked the first time they occur and defined in a box containing the keywords symbol. Make sure that you read the definition of any words that you are unsure about.

1.2 Activities

Each session in the module will contain various types of activities. Each session contains one or more session activities to be completed, in the workbook, where indicated in the module. These activities measure your ability to recall and apply theoretical knowledge.

A pre-assessment is to be completed before reading through the module overview and introduction, and a post-assessment is to be completed once the entire module has been covered. This will measure the degree to which your knowledge has improved by completing the module.
At the end of each study unit a **summative assessment** needs to be completed. These assessments are longer than the session activities and will test your knowledge on all the work within the study unit.

### 1.3 Assessment instructions

Keep the following in mind before doing any of the assessments:
- All assessments are to be completed in the provided workbook.
- The manual contains all relevant information you will need to complete the questions, if additional information is needed, such as the use of online sources, facilities will be made available.
- Work through the activities in a study unit and make sure that you can answer all the questions before attempting the summative assessment. If you find that you are not certain of any part of the training material, repeat that section until you feel confident.
- The summative assessment must be done under the supervision of your trainer at the end of your learning period.

### 1.4. End users

Rwandan extension agents that face and interact with lead farmers, including Farmer field school facilitators and smallholder farmers. The targeted categories, from 1 to 11 are included in Box 1.
Box 1: Rwandan Extension Categories

1=Cell development officer (CEDO)/IDP
2=Sector agronomist
3=Sector livestock officer
4=District agronomist
5=District livestock officer
6=District veterinary officer
7=District director of agriculture, livestock and environment
8=Veterinary pharmacist
9=Crop/agronomic advisor for a private company
10=Crop/agronomic advisor for an NGO
11=Other field staff for an NGO
12=Farmer field schools facilitator
13=Farmer-promoter
14=Other
Community mobilization and farmer needs assessment

Module outcomes

After completing this module, you will be able to:
1. Explain why community mobilization is important
2. Employ appropriate approaches for community mobilization
3. Design processes and methods of community mobilization strategies that involve women, youth and people with disabilities
4. Know and apply steps of farmer needs assessment and utilization of their results.

Module overview

In this module, you will learn what community mobilization is and why it is important by discussing the roles of culture and diversity in a community and by describing the roles of gender, youth and people with disabilities. You will learn about using appropriate approaches for community mobilization including planning and carrying out a livelihood assets assessment and analyzing, interpreting and applying the information from these assessments. You will also learn how to recognize different problem solving approaches. In designing processes and methods that involve women, youth and people with disabilities, you will be able to discuss the role of leadership development in community mobilization and apply resource mobilization strategies in community mobilization.
Module introduction

Community mobilization is a process whereby local groups are helped to clarify and express their needs and objectives and in taking collective action to meet them. It emphasizes the involvement of the people themselves in determining and meeting their own needs. It is closely linked with participation and resilience and recognizes that the problems the local population may face cannot always be solved on an individual basis. The main purpose of community mobilization is to get the community to recover from any shocks they may experience and to be able to deal with similar situations in the future in a self-sustaining way.

Why does community awareness-raising require facilitation ability?

Therefore learn communication strategies which encourage
Definitions of “Facilitation” and “Facilitator”

The word “facilitation,” which forms the core theme of this module, has no clear definition in general everyday usage, but the Facilitators Association of Japan defines it as “Supporting the ability of a group of people to easily take action, and providing direction to ensure that actions can proceed smoothly. Working to promote group problem-solving, idea generation, education, study, and various actions related to knowledge creation activities.” A person responsible for facilitation is called a facilitator. In the context of business meetings, this person is known as a “chair.” In this module, facilitation is considered as one method for encouraging the participation of communities, as “a method for generating dialogue leading to consensus-building among residents of the communities, by raising resident awareness toward problem-solving.” In this context, the people who use this method while overseeing dialogue between communities and project-related parties are called facilitators.

Complete the pre-assessment in your workbook.
Study unit 1: Culture and diversity including gender, youth and people with disabilities

Study unit outcomes
After completing this study unit, you should be able to:
1. Discuss the relevance of culture and diversity in guiding a local community to develop a vision; and
2. Describe the components involved in building a diverse and inclusive community that recognizes women and youth.

Study unit overview

This unit enables you to appreciate how different cultures and diversity can be used as opportunities to enhance your achievements as an extension professional working with rural communities.

Study unit introduction
The unit will introduce you to information and skills about the importance of culture and diversity, and about including all groups within a community, that you can approach to community mobilization and the importance of a vision for an inclusive local community. You will learn some skills to build a diverse and inclusive community, and enhance women, youth and people with disabilities participation in community mobilization.

Last but not least, you will also learn how to carry out a farmer needs assessment by being introduced to its key steps; including...
Session 1.1: Understanding culture and diversity

Session outcomes
After completing this session, you should be able to:
1. Recognize the importance of culture in community mobilization; and
2. Recognize the importance of diversity in community mobilization.

Introduction
Culture is a strong part of people's lives. It influences the following aspects of their lives: Views, values, humor, hopes, loyalties, worries and fears.

When you are working with people and building relationships with them, it helps to have some perspective and understanding of their cultures.

Culture and diversity
In any community, you will find that there are accepted practices and roles for each person that are determined by the community's culture. Different cultures will determine different societal norms and it is important for you as an extensionist to know what the norms are for the community you serve so that you can give the best advice for the situation.

When there are different cultural groups living in the same area, there is diversity. During your work as an extensionist, you may identify different ways in which the different cultures approach agriculture that can work together to benefit the community as a whole. Your role will then be to find out if the different groups...
would be willing to work together to better the situation for everyone in that area. This means you will try to recognize unique strengths and perspectives in individual cultural/ socio-economic community.

Overcoming and preventing divisions

To overcome divisions, it is important to know where divisions exist. Where there are differences in cultures, there can be conflict and divisions. In a single culture there could be divisions due to age, gender, family ties and standards of life.

People who may not be related may live in the same village. While they have common interests and similar access to resources because they are in the same village, there may be an extensionist, it is important that you work equally well with all residents in a village so that there will be no feeling of preference for one group over another.

Age and level of education plays a role because there will according to their age and level of education. Young and about how things should be done. Traditionally, elders in the community are the decision makers because of their experience but skilled people are given consideration for new innovations and technological aspects.

Gender equality and education for all does not allow division of farming activities according to gender consideration but promotes division of farming activities

Importance of inclusion in decision making processes

processes will give them ownership of their development. Identifying where the decision-making power lies in a larger
community will enable you to advise those who will influence others to make the changes. The decision makers will be able to say if a proposed change will be accepted by the community or not.

By being included equally, different leaders from different cultural groups are given an opportunity to reach a compromise with each other when sharing ideas to benefit the larger community.

How cultural groups influenced history

Culture has shaped farming systems, land tenure, inheritance, festivals and ceremonies, and traditional means of communication. These are all things that will influence the type of advice you would give a community as an extensionist.

Domestication and cultivation of food crops caused a shift from a society of constantly moving life meant there were more permanent dwellings built. Later, the invention of grain processing and storage facilities came about.

Domestication of some animal species meant that people did not have to go out to hunt for food. Settled life also meant the beginning of division of labor and a slow division between rich and poor within villages. Farming systems developed over time from a rotational slash-and-burn system to one where crop intensification program/ agriculture became a priority to cater for food security for the growing population.

In modern times, it has been found that the farming system used in a given area may be the result of the population of that area adapting to their surroundings and working with the resources available to meet their needs.
Module 8: Community mobilization and farmer needs assessment

Land tenure: Who has ownership of land according to the law.

Domestication: Growing and developing wild food plants to turn them into the cultivated crops we know today. Taming wild animals over time to keep them as livestock.

Crop intensification program: Policy aimed at boosting agricultural productivity through an improvement of input use.

Complete Activity 1.1 in your workbook.
Session 1.2: Vision for inclusive local community

Session outcomes
After completing this session, you should be able to:
- Discuss diversity in a community;
- Describe the relationships between cultural groups;
- Identify the importance of building alliances within cultural groups; and
- Identify common issues among different cultural groups.

Introduction
People have very different views of what a multicultural society or community should be like or could be like. People struggle with different visions of a fair, impartial, moral and harmonious society. What kind of community do you envision for yourself? How will diversity be approached in your community? If you could have your ideal community right now what would it look like? If you can’t have your ideal community right now, what will be the next steps you will take in building the kind of cultural community you want? This session allows you to understand diversity in a community and why it is important for different groups within a community to work together in an inclusive local community.

Multicultural society: A society that is made up of different cultural groups living together in the same community or area. Inclusive local community: A community in which all people are accepted and included in the decision-making processes in the community.
Diversity in a community

Diversity in a community refers to the mix of people of different genders, ages, cultures and income brackets living in the same area. These are just a few examples of how people differ from each other. It is important to be aware of the diversity in a community in order to understand how people’s livelihood is affected, and how they would cope in the event of a disaster or in a changing environment. It is also helpful to be aware of this diversity when you are planning interventions, identifying stakeholders and engaging with the community.

Relationships between cultural groups

Relationships between different cultural groups can be formed based on what those groups have in common. If they live in the same area, they will share access to the same resources and can form a relationship around that.

Within cultural groups, the challenge of how cultural vulnerabilities of that group exists. You should always be aware of these factors when planning your interventions so that you can make sure that your plan’s proposed benefits are inclusive of all the sub-groups within a cultural group.
Building alliances and coalitions within cultural groups

People will be willing to work together when they know that they mutually benefit from the alliance. If the benefit of working together outweighs the differences between cultural groups, then there is a very good chance that you can build an alliance between groups in an area.

These aspects complement each other, so that you can emphasize why working together will achieve more than if each group tries to work alone. Find the obvious conflicts between groups and see if there is any way that they could work together peacefully toward the common goal of the community as a whole.

Common issues that different cultural groups have

The same resources will experience the same challenges. It may be that different groups will have different levels of resilience to these challenges as a result of their day-to-day living according to cultural norms.

the same area will have access to the same types of food crops and markets. Culture can determine how land is distributed and owned, and how food is produced and distributed.

Complete Activity 1.2 in your workbook.
Session 1.3: Building a diverse and inclusive community

Session outcomes
After completing this session, you should be able to:
1. Recognize the importance of dignity and hope in community mobilization;
2. Build a team for community mobilization; and
3. Use community diversity in community mobilization.

Introduction
In order for people to commit to working on diversity, every person needs to feel that they will be included and important. Each person needs to feel welcomed in the effort to create a diverse community and that their culture is important to others. People are more likely to change when they are appreciated and liked, not condemned or made to feel guilty about their cultural backgrounds. It is important to include vulnerable members of a community when deciding which will be the most appropriate action plan to implement for the benefit of the community as a whole.

Dignity and hope in community mobilization
It is important that vulnerable groups within a community, such as the sick, elderly or people with disabilities, be treated with dignity.

When designing an action plan for community mobilization, especially during disaster situations, you will need to take any additional needs of the vulnerable members of a population that require funding or infrastructure into account. You will need to consider whether there is an adequate supply of clean water and
sanitation to care for the sick, or prevent disease outbreaks. You will also need to check if there is adequate nutrition available for children, elderly, or sick members in a community by assessing what types of food crops a disaster struck or a displaced community has access to. You also need to take any livestock account and how this impacts a household or community.

In the aftermath of a disaster there may be households that are left displaced and destitute and it is important to treat those like a WKHGLVWHUZLWKGL]QLW\.

When presenting the report of the impact of a disaster to a community affected by it, you should be sensitive to the fact that they are trying to deal with the sudden extreme change in their situation. When working with them to find a solution and an intervention that can help them recover, it is important to give them hope that their situation will change for the better and that they will recover from the shock. When people have hope, they will be willing to do everything they need to rebuild their lives.

Building a team for community mobilization

When building a team for community mobilization, you will need to assess what the community's needs are and find people who have the skills and capabilities to address all the different aspects of the proposed action plan to achieve the goal. To address diversity issues, your team needs to be diversified in order to relate to these issues and to be able to come up with creative ideas to address these issues.

Using community diversity in community mobilization

As mentioned previously, it is important to be aware of the diversity already present in the community you are working with so that you can have a better idea of which approaches to solving the problems would work best. You will also be able to motivate
the community members to implement the action plan they need for change.

By encouraging different groups within a community to work together, the community as a whole will be able to solve their problems more effectively and in a sustainable way.

Complete Activity 1.3 in your workbook.
Session 1.4: Enhancing women and youth participation in productivity

Session outcomes
After completing this session, you should be able to:
- Discuss the importance of gender differences in community mobilization;
- Identify the importance of youth participation in community mobilization; and
- Explain how to support women and the youth in community mobilization.

Introduction
Gender equality exists where women and men have access to opportunities and services, equal control over resources and an equal say in decisions at all levels. Evidence demonstrates that where gender equality is greater, there is higher economic growth and better quality of life for all.

Skilled youth participation in community mobilization
The youth are the future of a community. By encouraging youth participation in community mobilization you will be motivating them to feel that they add value in their community. It can teach them how to be responsible for their own success and that of their community. It may even encourage them to identify needs in their community.

There may be some cultural norms, such as only members of a certain age being allowed to make decisions in the community, that would normally exclude the youth from a wide range of participatory activities. Bringing education, competitions or
information days to schools could be a good start in promoting an enabling environment for young people’s participation in a broad range of processes and areas.

**Support for women and youth in community mobilization**

It is the norm for adult men to be the primary land owners in many communities. While women do grow food crops for household use, they will still rely on the majority of the household income to come from the men.

The youth, because of their age, will not have decision making power within a community and will also not be able to own land of their own. They will most likely be included in a supportive role to carry out designated tasks to contribute to their households. They are also of school-going age and may spend most of their time in school, if they are able to attend one.

Targeting and providing safety-net support for women and youth will enable them to contribute more to the community. Running programmes designed to empower women and the youth in a community, and providing them with education on issues directly affecting them, will encourage them to be positive influences on community change. When you include and talk to women and youth, you will find that they can generate ideas and solutions to problems that affect them directly, which will give a more holistic perspective to the needs of the community that need to be addressed.

📝 Complete Activity 1.4 in your workbook.
Concluding remarks

Culture and diversity will determine how you approach, design and implement an intervention for community mobilization. Understanding the differences that are found in a multicultural society will help you formulate a vision for an inclusive local community. Building a diverse and inclusive community means that women, the youth and vulnerable members of the population should be included when the action plan is designed. Women often exclude them from contributing beyond carrying out their expected tasks. Make sure you offer support to these groups when implementing the action plan.

Complete the summative assessment in your workbook.
Study unit 2: Livelihood assets assessment

Study unit outcomes
After completing this study unit, you should be able to:
1. Describe the sampling and assessment planning process; and
2. Demonstrate the core components of livelihood assets assessment.

Study unit overview
This unit enables you to appreciate how livelihood assets assessment has become the basic framework for many organizations’ programme analysis, design, monitoring and evaluation. It grows out of a food security perspective. It is based on the observation that food is only one important basic need and adequate food consumption may be given up for other more important needs.

Livelihood assets assessment: An assessment of all resources available to a community, including human capital and other assets such as land, crops, livestock, water sources and infrastructure. Food security:
Study unit introduction

The causes of poverty are complex. In this unit you will learn how livelihood assets assessment provides a framework to analyze and understand poverty and how people deal with it. You will learn more about the process of compiling a livelihood types.
Session 2.1: Gathering information

Session outcomes
After completing this session, you should be able to:
1. Set objectives;
2. Use appropriate assessment types for a given situation;
3. Identify what information is needed for a livelihood assets assessment; and
4. Use appropriate data collection methods for a given situation.

Introduction
The key to conducting a successful livelihood assets assessment is to take time before beginning an assessment to formulate objectives, determine the information needed for decision making and the most appropriate information sources and data collection methods. Even if time is limited, initial investment in the planning stage will save time later and provide the most useful information. Even with limited time, initial investment in planning will save time later and provide the most useful information. It is also important to be flexible during the data collection process to pursue alternative pathways or follow-up on unexpected information. The assessment is a dynamic process where information collected early in the process will help shape some of the questions that are asked and the data that is collected later.

Setting objectives
It is important to set objectives so that you will know what the community hopes to accomplish from making changes. This end goal will depend on the situation. It is also important to think about whether your objectives and those of the community are the same.
Looking at it from a food security point of view, ask yourself if households in the community want to grow their own food. Would they rather want to start growing cash crops to buy their own food?

When thinking about how to advise your community, ask yourself what challenges they may face in meeting their expected goals. Are they willing to adopt new technology in achieving their objectives? What methods are acceptable to their cultural systems?

Livelihoods are dynamic because they are shaped by a number of different factors that are constantly changing. These factors include changes in access to specific markets, changes in food prices, available income sources within households, seasonal changes in livestock or crop farming and more importantly the impact on livestock and crop farming in times of drought or floods.

**Assessment types**

There are a few assessment types you can consider. The baseline livelihood assessment looks at what is needed for normal day-to-day functioning of a household. It assesses whether a household has access to adequate resources and income to meet their basic needs in a sustainable way.

Assessment types you can consider. The baseline livelihood assessment looks at what is needed for normal day-to-day functioning of a household. It assesses whether a household has access to adequate resources and income to meet their basic needs in a sustainable way.

Assessment types you can consider. The baseline livelihood assessment looks at what is needed for normal day-to-day functioning of a household. It assesses whether a household has access to adequate resources and income to meet their basic needs in a sustainable way.
Information needed for a livelihoods assets assessment

A household’s basic needs are:
1. Enough food and clean drinking water;
2. Access to housing;
3. Health facilities;
4. Opportunities for education; and
5. Enough time to be active members in their community.

When doing a livelihood assets assessment you must consider if the following are available:
1. Natural capital;
2. Human capital;
3. Social capital;
4. Physical capital; and
5. Financial capital.

These concepts will be discussed in more detail in the following sections.

Natural capital

These are the natural resources available to the community, including farming land, grazing, water sources, wildlife and forests.

Human capital

Human capital focuses on the demographics of a community as well as the knowledge and skills the people in the community have. How many men, women and children are there in the community? What is the age distribution? How many children and youths are still of school-going age? How many men and women are of working age? How many women and men are of retirement age, or considered elders? Are the people, especially those who make up most of the labor force, healthy and physically capable of carrying out their tasks?
Social capital

This looks at the networks, affiliations, associations and social relations that are present in the community. This can include cultural groups and family groups. It is important to include this in your assessment because it will impact how willing a community is to engage in coordinated actions.

Physical capital

Physical capital refers to basic infrastructure, houses, vehicles, production equipment and technology and livestock and crops which can be used to pursue any livelihood strategy. These things can be used to increase financial capital.

Financial capital

This refers to the capital base of a household and the community. What is the source of income for the household? Are households involved in subsistence farming activities to provide food for them? Are there commercial cash crops produced in the area? Who is responsible for producing those crops? Who is responsible for distributing the income received from selling those crops? Are there saving clubs in the community to finance activities? This includes cash, credit, debt and savings.

Data collection methods

Information on what resources are available to each household can be collected through different methods. These methods are described below:

- You can meet with key informants at district, sub-district and household levels and interview them or give them questionnaires;
- You can conduct household surveys that include information on the labor force and employment, health and nutrition, household income and expenditure, food consumption and food security;
Population census data, if available, can be used to determine human capital availability;

Agricultural census data, agricultural surveys, crop assessments and agricultural production estimates will generate data relating to food security;

Population census data, agricultural surveys, crop assessments and agricultural production estimates will include analysis of farming systems, community surveys and ethnographic studies;

Other sources of data are statistics on health services, nutrition services and social protection programmes in the area; and

Maps, geographic information systems*, satellite imagery and watershed maps can be useful when you need information about agro-ecological zones.

Ethnographic studies: Systematic studies of people and cultures.

Geographic information systems: A computer system for capturing, storing, checking and displaying data related to positions on the Earth’s surface.

Satellite imagery: Images of the Earth’s surface taken by satellites that provide details not otherwise shown on maps.

Watershed maps: Maps of rivers, basins or seas in an area.

Agro-ecological zones: Geographical areas with similar climatic conditions that determine their ability to support agriculture.

Complete Activity 2.1 in your workbook.
Session 2.2: Sampling and assessment planning

Session outcomes
After completing this session, you should be able to:
1. Use the correct steps in planning an assessment;
2. Use the correct sampling methods;
3. Determine sample size; and
4. Discuss bias considerations in sampling.

Introduction
Both the time and human resources needed to undertake OLYHOLKRRGDVWHVVDVVHVPHQWLQWKHOGDUHXQGHUHVWLDPW planning process takes time and is, more often than not, circular. All tasks should be started as soon as possible. Many of the steps will be undertaken concurrently and continuously throughout the assessment with the completion of one task sometimes requiring adaptation of another. Aside from developing the tools and methodology for the livelihood assets assessment, you should pay close attention to planning and carrying out the assessment at all stages in order to make sure that you successfully collect data and use resources.

Steps to planning an assessment
Before planning an assessment, some preliminary studies will need to be done. As part of the preliminary data collection you will do a context analysis, stakeholder mapping and engagement and livelihoods zoning. You need to allow enough time for face-to-face meetings and for conducting the various surveys. Pre-assessment activities include gathering LQIRUPDWLRQDWLRQDOUHJLRQDODQGORFDOOHYHOVDQGGRQLQJDQ YLVLWWWRFROOHGWGDWIRPJRHYUQPHQWRALDOVORFDODV*2VDQG meeting with key informants from the community.
Stakeholder mapping: Identifying all stakeholders and which

Livelihoods zoning: The process of grouping together geographical areas where people have the same access to food and income and access to the same markets.

Next, you will need to identify the methods you would like to use to collect the data you need from an area. This is the preparation step where you will formulate objectives, select your sampling method, recruit your team and train them if necessary, and develop tools needed for the tasks to be carried out. In this step you will also set up your time allocation for your assessment as well as work out a budget. Pilot tests of the questionnaires should be carried out before the actual fieldwork begins and should be included in the time allocation. During fieldwork you will carry out different surveys such as market surveys and household surveys. You will identify which coping strategies are already in place. You will also do vulnerability and capacity mapping and hazard mapping.

Once all the data is collected, you should plan for daily data debrief sessions and analytical workshops so that you and your team can order the data and enter it into a database. The raw data must be cleaned and tabulated to make analysis and interpretation easier.

When the data has been analyzed and interpreted, communities in the form of studies or severity analyzes for food and livelihood security. This information can be used to generate a vulnerability ranking for the area and thus to identify appropriate responses to a situation. The following are the main steps in planning and assessment:

Preliminary data collection  Preparation  Fieldwork  Data entry and interpretation  Report of findings
Introduction to sampling

Before collecting data you will need to decide two things. One is how you will collect the data you need, in other words, a sampling method. The other is how much data you will need to collect for your analysis to be meaningful, in other words, determining the sample size. You will also need to consider bias in your data. It is impossible to collect information from every area or from every household in a given area when doing livelihood assets assessments. To compensate for this, data is usually collected from a sample area to represent the whole area as closely as possible. It is important that the sizes of the data samples are big enough to be a meaningful representation of the real situation.

Bias: When you collect data, you will expect to get a certain result from the information. Bias refers to the difference between the actual results that were generated from the data analysis and the results you expected to get.

Sampling methods

The sampling method you choose will be determined by the goals of the assessment as well as constraints on time, resources, access and security.

There are two main methods to use in sampling, namely non-probability sampling and probability sampling.

Non-probability sampling is mainly used with qualitative methods such as selecting key informants or interviewing traders in markets. These sampling methods have a high chance of introducing bias into the results because it depends on the selective judge of community leaders.
**Non-probability sampling:** Any sampling method where some units have no chance of being selected or the probability of selection is unknown.

**Probability sampling:** A sampling method used when every unit has a chance of being selected, the probability of being selected is known and the selection of the sample is made using random methods.

There are three types of non-probability sampling methods, namely purposive, convenience and snowball sampling. Purposive sampling tries to minimize bias by selecting a sample which best represents the study population. Researchers do this by deciding which particular individuals or groups are best to interview. Convenience sampling results in bias because the respondents are chosen based on how convenient it is to interview them. This could mean that in a given area, communities that are easy to access are selected, while communities that are difficult to access are not.

Snowball sampling is so named because it starts with a small sample and then as information is collected more samples are taken, in other words, it grows like a snowball. An example of this would be when you start interviewing some key informants on a situation. These informants might point you to others in the community who have experienced the same issues and who could provide useful information.

Probability sampling, or random sampling, is the method that has the potential to represent the entire sampling frame and is used where quantitative data is collected for statistical analysis. This method uses household questionnaires and the data collected from these can be expanded to a larger sample population. There are many probability sampling methods, but for the purposes of this module, only simple random sampling, systematic sampling and stratified sampling will be discussed briefly.
Simple random sampling is used when a list of every household or individual is available and respondents are randomly selected from the whole list using a random number of tables.

Systematic sampling is the most common sampling method used to select households within a cluster and is often used in camp situations and in urban contexts. It is used when there is a list of households and when there are no such lists but the population lives in the same geographical area and houses are arranged in a regular geometric pattern. After selecting a first household at random, the following households are visited ‘systematically’ using a ‘sampling interval’ determined by dividing the total number of households by the number needed to give an adequate sample.

Stratified sampling is used when the study population contains distinct strata or sub-groups that can be sampled independently and it allows information to be collected about specific sub-groups that would be difficult to collect if the population was sampled as a whole. This method is especially useful where livelihoods or regional groups are unique to these groups. It allows you to compare these differences. If the population figures are known, it is important to sample the sub-groups proportionate to the size of the whole population to maintain statistical efficiency.
Module 8: Community mobilization and farmer needs assessment

Statistical efficiency: Making sure that the statistics you generate from your data are a true reflection of the actual situation in the field.

Determining sample size

The definition of a sample size is the number of sampling units required to give the level of precision you need. For the purpose of livelihoods assets assessments, a sampling unit is a household.

What is the correct sample size? This will depend on the sampling method you have chosen. The accepted rule for household food security and livelihood assessments when using purposive sampling is to sample 50 to 150 households for each area the assessment is designed to evaluate. Remember, the point of sampling an area is to represent its diversity accurately. The more diverse an area the more samples you will need, in other words, a larger sample size. When you use random sampling, a sample size of 150 to 250 households is recommended for every area you want to compare.

Bias considerations

and the true value of a parameter that is being estimated. There will be situations where sampling bias cannot be avoided due to different constraints. It is important that you are aware of bias and, if possible, choose the sampling methods that will minimize it best. Remember that selection bias is most likely to occur when using non-probability sampling methods. In purposive sampling it becomes important to choose the samples so that the assessment accurately represents the diversity in a population.

When using random sampling it is important that all members of the population have an equal chance of being selected. When data is extrapolated to refer to a larger population, sampling bias...
may occur if the data of the surveyed population did not consider diversity.

Complete Activity 2.2 in your workbook.
Session 2.3: Core components of livelihood assets assessments

Session outcomes
After completing this session, you should be able to:
1. Describe context analysis;
2. Discuss the importance of food security in community mobilization; and
3. Identify correct coping strategies for a community.

Introduction
Livelihood assets assessment approaches rely on a common logical framework built around core components whose analysis allows you to meet the broad objectives. Each core component and its associated set of indicators needs to be addressed in some form in order to ensure a minimal degree of shared understanding and permit comparative analysis across settings. The depth of analysis on each component will be different depending on the type of assessment being carried out and its specific objectives.

Context analysis
Understanding the context of the community you serve will help you to understand the factors that influence livelihood systems. The parameters within which the livelihood strategies function are determined by the information on the following aspects of an area:
1. Social;
2. Economic;
3. Political;
4. Environmental;
5. Demographic;
6. Historical; and
7. Infrastructure.

These aspects can help you identify which population groups are most vulnerable and who the main actors are in the field when it comes to local and national response capacity in a crisis.

**Livelihood groups and zones**

A livelihood group is a collection of people who share the same income and food sources. They have access to the same livelihood assets and are exposed to similar risks. A livelihood zone is a geographic area with similar food access as determined by geography, livelihoods dominant in the area and market networks. Grouping livelihoods will help you decide which interventions may be helpful to improve food security for particular groups in similar situations.

**Markets and price trends**

Markets are the backbone of economies. People living in cash or mixed economies will be dependent on markets to meet their basic needs. Market analysis is important in determining how the market trends will be affected in the event of a disaster. Market analysis provides important information about food access and availability. Price variations can occur according to season, or due to crisis or conflict.

**Food security and community mobilization**

Food availability is how much food is physically available in a given area. It depends on food production from fishery, animal husbandry and crop production systems. It also depends on food stocks and reserves.
Module 8: Community mobilization and farmer needs assessment

The food production system used by a population will depend on the area because they will adapt their systems to suit the geography and rainfall conditions of the area they live in. This makes it important to establish a production baseline to determine how food is produced under normal conditions. The assessment of food availability should take into account any challenges that the community faces in producing food. This can include labor constraints or even assessing whether households have the purchasing power to successfully produce or purchase food.

Governments are usually responsible for keeping grain food that is available. It refers to whether households have enough income to buy food at markets. It can be a measure of a household’s power in the community and how strong their social networks are. Increased food security and increased household income can be measured by how many households have food access.

Food access

The energy and nutrient intake of households is measured through their food consumption. How often people eat and the variety of their diet should be considered because food consumption patterns are indicators of a household’s food access. Household food consumption is influenced by cultural and religious beliefs and traditional habits, where food taboos can restrict using food that the household based on their age, gender and working status as governed by traditions.
Food utilisation and care practices

How a household uses the food that it has access to is called food utilisation. It includes food storage, processing and preparation, and distribution within a household. It also refers to how an individual is able to absorb and metabolise nutrients from food, a process which is affected by malnutrition and disease. Individual food consumption patterns are indicators of food utilisation.

Care practices refer to:
1. How infants and young children are fed;
2. How food is stored, processed and prepared in the home;
3. How food is shared in the home; and
4. What food habits and taboos are present in the household.

Care practices include how sick children, adults and the elderly are cared for and what hygiene practices are used by members in a household.

Coping strategies

Coping strategies are the actions that people take at a household level to manage their resources in times of hardship. This is an indicator of food access and livelihood security. Coping strategies can include food rationing in times of food shortage and changing food sources.

Economic coping strategies, such as buying on credit and labor migration can be implemented to preserve assets in times of hardship. When permanent strategies, such as sale of assets, are used as a coping strategy it indicates a crisis and it can permanently impact food security in an area. Adaptation to a severe situation is a long-term solution that encourages the development of new livelihoods. This includes pastoralists moving to areas where the rainfall and pasture growth is better or displaced farmers becoming small traders and casual workers to get through the hard times.
The severity and length of a crisis will determine whether people adopt short-term, temporary coping strategies or whether they adopt long-term, adaptive coping strategies to avoid becoming destitute.

**Participatory vulnerability and capacity analysis**

Participatory vulnerability analysis assesses the historical evolution of a local vulnerability context. It is useful to tell the difference between acute and chronic food insecurity sources and broad livelihood stressors.

Capacity analysis on a local level helps to design programmes that will engage stakeholders in a participatory way to better address vulnerability in the population and reduce the risks they face.

.ejb Complete Activity 2.3 in your workbook.
Session 2.4: Analyzing results

Session outcomes
After completing this session, you should be able to:
1. Analyze and interpret data in the assessment process;
2. Identify causes of food insecurity and risks to livelihoods; and
3. Establish a vulnerability ranking.

Introduction
Data analysis and interpretation should be done throughout the assessment process to identify major causes of food insecurity and risk to the livelihoods of a community so that corrective measures can be implemented to reduce the risks.

Data analysis in the assessment process
Data analysis should occur on an ongoing basis at every stage of the assessment process.

When preliminary data is collected, data analysis is used to make decisions about target populations, sampling methods and approaches. During training workshops, data analysis is used in designing the appropriate field tools. Analyzed data collected from pilot tests are used to refine the field tools and to define appropriate thresholds and norms for fieldwork.

Before leaving field sites once fieldwork has begun, data is analyzed so that the preliminary findings can be validated and then presented to the local authorities. During analytical workshops with team members, data is analyzed to gather additional insights that were not formally recorded. Once data entry is complete, analysis is done to put together results and analytic charts and models are prepared.
In workshops with local stakeholders, the results from data analysis are shared to build consensus on priority needs and responses.

### Identifying principal causes of food insecurity and risks to livelihoods

In workshops with local stakeholders, the results from data analysis are shared to build consensus on priority needs and responses.

#### Identifying principal causes of food insecurity and risks to livelihoods

In workshops with local stakeholders, the results from data analysis are shared to build consensus on priority needs and responses.

**Identifying principal causes of food insecurity and risks to livelihoods**

In workshops with local stakeholders, the results from data analysis are shared to build consensus on priority needs and responses.

**Identifying principal causes of food insecurity and risks to livelihoods**

In workshops with local stakeholders, the results from data analysis are shared to build consensus on priority needs and responses.

When assessing the situation, it is important to distinguish **acute** risk factors from **chronic** risk factors, because the interventions will differ for each situation. For acute, short term interventions to be sustainable, you must make sure that there are no chronic risk factors that will undermine the response to the intervention.

**Acute:** An event that happens in the short term or immediately.

**Chronic:** An event that happens more slowly over a longer period of time.

**Macroeconomic policies:** Policies implemented by government that affects trade of a larger area or a country as a whole. Some policies can also affect global trade.
Determining the severity of livelihood insecurity

Once you have done a context analysis, it is time to analyze how the crisis has impacted each livelihood group to determine which make the problem of food supply and food access worse in a local area.

Changes in household food and income sources, types of coping strategies used and changes in household food consumption patterns need to be noted. Market survey data that shows price movements for key commodities, impacts on labor markets and terms of trade also need to be looked at to determine the severity of livelihood insecurity.

Estimating the scale of livelihood insecurity

The scale of livelihood insecurity refers to how many households can be calculated using the total population numbers for a surveyed area together with information about how many of the number of households and individuals in each of the by donor agencies to know how many people need help and what level of resources in needed to help them.

Establishing a vulnerability ranking

of food insecurity and risks to livelihood. A vulnerability not all groups within that population will experience the same severity of impact. This means their recovery rates will be

Groups or zones are ranked according to their relative vulnerability based on the key vulnerability criteria that the

Concluding remarks

It is important to set objectives to know what the community hopes to achieve from the changes they make.

Baseline livelihood assessment to determine the day-to-day types to assess the impact of a disaster on a community.

Use systematic steps when planning your assessment to make sure you collect all the information you need to design an action plan. Choose the correct sampling method and sample size when collecting your data for assessment.

Complete the summative assessment in your workbook.
Study unit 3: Problem solving approaches

Study unit outcomes

After completing this study unit, you should be able to:
1. Describe community decision making based on data;
2. Explain the root causes of problems; and
3. Devise sustainable community solutions in a participatory manner.

Study unit overview

Problem-solving approaches are used to address many issues that come up on a daily basis in the local community. While you may have already engaged in solving problems, you have probably used many different approaches in order to achieve a solution. In this study unit, you will learn about defining a problem and its root cause rather than reacting to superficial symptoms. You will also learn how to devise sustainable community solutions in a participatory way.

Introduction

A structured, systematic approach to solving problems and making improvements ensures consistency, helps manage builds a convincing case for change, and presents a convincing rationale for community action. In this unit, you will be introduced to basic problem solving approaches.
Session 3.1: Defining problems and their root causes

Session outcomes
After completing this session, you should be able to:
1. Define a problem; and
2. Determine the root cause of a problem.

Introduction
Identifying the problem means doing a broad review of the current situation. Once you recognize the symptoms and have information about the nature of the problem.

Defining the problem
Why is defining a problem necessary for problem solving? The obvious answer is that you need to know exactly what needs to be changed to make a situation better. When you know what needs to be addressed, you can start designing your action plan to address the issue in a way that will give a problem that a community faces by talking to individuals living in the area and by doing additional surveys for the livelihood assets assessment.

Determining the root causes of a problem
Every problem has a root cause, which is the reason the problem and changes the situation that was present because of the problem.
In the context of a community’s food security, the assessments and analyzes of data collected through various surveys in the field can help you identify the root cause of the problem of food access and availability. Ask yourself the following questions:

1. Does the baseline livelihood of a community make them more vulnerable to begin with?
2. What can be done to improve the baseline livelihood in that community to make them more resilient to possible disasters?
3. Are their farming or food production methods not adequate to make enough food available?
4. Can these methods be adapted in some way to increase crop yields?

Complete Activity 3.1 in your workbook.
Session 3.2: Participatory development of a basket of options

Session outcomes
After completing this session, you should be able to:
1. Identify a range of solutions in problem solving; and
2. Describe the importance of participatory development of different solutions.

Introduction
Once you have defined a problem, your immediate reaction may be to jump toward a particular solution. Remember that creative problem solving requires you to explore a full range of viable solutions before reaching a conclusion. At this stage, you are still not ready to select the best solution. You simply want to reduce redundancy, and eliminate any possibilities that do not address the problem. Force field analysis is a good tool for preliminary screening of this solution field.

Generate potential solutions
Creative problem solving has the benefit of generating a list of possible solutions that you can choose from to solve a particular problem. The best approach to finding a solution that will be best for a community is to sit down with the whole community and brainstorm ideas of how to solve the problem they have. Including all members from the community will give you many different ideas of how to solve their particular problems. In addition to
that new innovations and technologies are communicated to the community through training for adoption.

Ex: use of hybrid seed and in vitro plantlets to solve a problem of low productivity and resistance to diseases.

**Relate solutions to root causes**

When you have set up a list of possible solutions, look at the root causes of those problems.

When you have identified the root causes, get the community involved in choosing the best possible solution that will address the root causes of the problem.

**Merge similar solutions**

Group ideas that are related or similar in the list of solutions you generated with the community. Perhaps you could look at the list of root causes to the problems and group all possible solutions in a way that makes it easier to choose the best possible solution.

Complete Activity 3.2 in your workbook.
Session 3.3: Participatory selection of an appropriate solution

Session outcomes
After completing this session, you should be able to:
1. Determine if a solution is feasible; and
2. Evaluate if a solution is acceptable.

Introduction
Evaluate each potential solution for its strengths and weaknesses.

Determining solution feasibility
When you have decided on a solution, you must consider if it can be practically implemented.

Ask yourself the following questions to test the feasibility of the chosen solution:
1. Can it be implemented in a reasonable time?
2. Can it be done within cost limits?
3. Will it work reliably?
4. Can it be implemented in a reasonable time?
5. Will it work reliably?

To plan the tasks in the action plan so that they are implemented
Evaluating solution acceptability

You have chosen a solution to a problem and you have seen that it is feasible. Now you need to consider whether this solution is acceptable to the community and to the donor organization that might be funding the project. To evaluate the chosen solution’s acceptability, ask yourself the following questions:

1. Do the implementers support the solution?
2. Do the implementers perceive it as worth their time and energy?
3. Are the risks manageable?
4. Will the solution benefit the persons affected by the problem?
5. Will it benefit the organization?

If you answer yes to all these questions, you know you have found the best possible solution to the given problem and implementing this solution should not be problematic.

Complete Activity 3.3 in your workbook.
Session 3.4: Participatory implementation

**Session outcomes**
After completing this session, you should be able to:
1. Discuss why participatory implementation of a solution is important; and
2. List the steps of implementing a solution.

**Introduction**
Choosing a solution does not immediately solve a problem. The implementation stage requires action planning.

**Importance of participatory implementation**
Choosing a solution does not immediately solve a problem. The community will be affected by the plan you choose to implement to solve a problem and the hope is that this effect will result in a positive change to their situation. Participatory implementation means getting the community involved in making the changes and putting the plan that was agreed upon into action.

This is an important step in making sure that the changes that need to happen are actually carried out so that the problem is solved. It also gives the community the means to solve similar problems on their own if they encounter them in the future.

**Steps to consider for implementation**
Enough time allocated for each step. There needs to be people who have the skills and capability to do the work and there
needs to be a clear goal in place. The goal will be a date that tasks should be completed by. This is important for monitoring and evaluating progress. You must track the progress of the plan to see if a certain part of the plan needs to be revised if it was practically not possible.

Participatory implementation includes involving everyone in the community in solving a problem in a practical way. While you are planning an action plan, ask yourself the following questions:
1. What must be done?
2. Who will do it?
3. When will it be started?
4. When will key milestones be completed?
5. How will the necessary actions be carried out?
6. Why are these actions a solution?

This way the allocated tasks can be tailored to the situation and the community for implementation to be successful.

.pen Complete Activity 3.4 in your workbook.
Session 3.5: Participatory monitoring and evaluation

Session outcomes
After completing this session, you should be able to:
1. Monitor and evaluate an action plan; and
2. List the steps needed for effective monitoring and evaluation.

Introduction
Evaluation is the monitoring that any community project needs to ensure that milestones are met, costs are contained, and work additional feedback mechanisms to detect the need for midcourse corrections and to ensure that the problem is solved without creating new problems.

Midcourse corrections:
Changes made to a plan when it is already in action so that the best results are obtained when all the steps are completed.

Data collection
Monitoring and evaluating a project depends on regular data collection. This data will indicate if the plan is being implemented on time and if the expected changes are happening. Comparing data collected throughout implementation to data collected in the initial assessment will give information on whether progress is happening or if some things need to be revised and improved. Data collection methods used for monitoring will be much the same as those used for the initial livelihood asset assessments and vulnerability rankings.
Progress reports

The purpose of monitoring and evaluation is to track progress. The results of the analysis of data collected during the implementation phase of a project can be interpreted and organized into a progress report. This report should be distributed to the community and the donor organizations so that they know energy and funding poured into the project are generating results and are worth it.

Reflection on the process

Progress reports are useful to evaluate if the process is happening at the right rate. If for some reason activities are running behind target, you can focus attention on these activities to see how they can be improved. Monitoring and evaluation is a cyclical process and constant review of the plan and progress serves to streamline necessary part of implementation because sometimes things look that implementing a chosen solution will not cause other problems down the line.

Complete Activity 3.5 in your workbook.
Concluding remarks

To effectively solve a problem you need to define the problem and identify its root cause. Getting the community involved in finding a solution to their problem will give you a range of ideas that could be acceptable to the community that you can choose from. Once this list of possible solutions has been created, you need to test each option for feasibility and acceptability, and choose the best solution based on these criteria. Always relate the solution to the root causes of a problem to ensure that problem will be fixed permanently without resulting in other problems.

Complete the summative assessment in your workbook.
Study unit 4: Leadership development

Study unit outcomes
After completing this study unit, you should be able to:
1. Describe effective leadership that involves using consistent talent development and management programmes at community level; and
2. Identify, attract and mentor community leadership talent.

Study unit overview
Community-level leadership development is used to increase the effectiveness of extension workers in their local communities by cultivating their leadership skills. In this study unit, you will learn about the various leadership styles, how to develop your communication skills and how to lead and motivate your community co-workers. You will also learn about the benefits of mentoring and how to effectively manage your time. Finally, you will learn about participatory goal setting and accountability as well as how to use teamwork effectively.

Introduction
To be a leader means you need to be aware of different leadership and communication styles and know how to motivate others to achieve their goals. This study unit will introduce you to all of these concepts for leadership development.
Session 4.1: Leadership styles

Session outcomes
After completing this session, you should be able to:
- Describe different leadership styles; and
- Discuss the importance of strong leadership.

Introduction
A leadership style encompasses how a person provides direction, implements a plan, or motivates others. To achieve their goals, effective leaders often switch styles to suit the situation.

When you are reporting quantitative data results, your communication style will most likely be direct and systematic. When you are meeting with a community to assess their needs, you should adopt a considerate communication style to gain their trust and confidence in your ability to help them find a solution.

**Characteristics of effective communication**

)LJXUHEHORIZLOOXVWUDWHVWKHYDULRXVFKDUDFWHULVWLFVRIHFV communication.

*Figure 1:* &KDUDFWHULVWLFVRIHFVLYHFRPPXQLFDWLRQ
For communication to be effective you will need to be an active listener, provide feedback and recognize possible barriers to understanding. Active listening means you hear what you are being told and you remember the information. You may repeat the information back to the person to let them know that you understand what they have said. Feedback ensures that everyone knows what is happening so there is no room for miscommunication. Communication barriers can result from language differences or even differences in education levels. Make sure you adjust how you communicate to make sure the information is correctly understood.

Communication is not only verbal. When you interact with someone face-to-face, there are many non-verbal communication methods in play. Most of these are automatic, so you might not be aware of them, and include facial expressions, gestures, silence, eye contact, and use of space. How close someone stands to you can give you an idea of how comfortable they are around you. Where they stand or sit in relation to you can give you this same information. It can also let you know, when eye contact can tell you if someone is comfortable talking to you or not. Be aware though that there are different rules about when eye contact is appropriate or not depending on the cultural norms in place in an area.

Complete Activity 4.2 in your workbook.
Session 4.3: Leading and motivating community co-workers

Session outcomes
After completing this session, you should be able to:
- Identify common motivators for volunteers;
- Manage challenges that come from leading friends or colleagues; and
- Identify the characteristics of a successful leader.

Introduction
Motivated and enthusiastic community co-workers are essential to successful farming. Knowing how to inspire community members will help encourage participation in sustainable community initiatives.

Common motivators of volunteers
Motivation is important when trying to empower and uplift a community. Motivation is the desire to achieve something. To motivate someone means that you encourage them to participate wholeheartedly. Some ways to keep volunteers in a community motivated are service, fellowship, networking and recognition. By staying connected to other volunteers, they can exchange ideas and talk about the challenges they face in their situation. By sharing this information they can get ideas about which approach they can take to overcome their challenges. Recognizing their efforts will make them feel appreciated and valued. This will encourage them to continue with their work and boost their performance.
Challenges when leading friends or colleagues

Volunteers in a community will find themselves leading friends or colleagues at times. Friendships and working relationships are interpersonal relationships where each person usually has equal decision making power, and decisions are reached through compromise and mutual agreement. The role of a leader is to take charge of a situation and make decisions based on their own best judgement. Part of the decision making process is to overrule suggestions made by friends or colleagues if they do not serve the purpose of achieving the goal. This is where conflict may arise because the dynamics of the interpersonal relationship have changed.

A strong leader will always work in the best interest of the community as a whole and not make decisions based on personal gain. This means they are usually able to deflect conflict by being diplomatic in their decision making. They will be able to set good boundaries with friends and colleagues so that personal considerations do not affect the decisions they have to make.

Characteristics of successful leaders

A successful leader is a good motivator of the people they are leading because they are skilled at providing a vision and inspiration. They are good at gaining people’s trust and building solid relationships, which stands them in good stead when it comes to managing possible conflicts. A successful leader will lead by example, in other words, they will never expect anyone to do anything that they are not prepared to do themselves. This inspires confidence in their abilities and people will be willing to do the tasks they are assigned.

Complete Activity 4.3 in your workbook.
Session 4.4: Mentoring

Session outcomes
After completing this session, you should be able to:
1. Discuss the purpose and application of mentoring;
2. Define the relationship between the mentor and mentee; and
3. Recognize the importance of sharing experiences and expertise.

Introduction
In a community mentoring process, an experienced person guides another person in the development of ideas and learning. It’s a good way for both the mentor and the mentee to enhance their skill sets, build relationships and advance professionally.

The purpose and application of mentorship
Mentorship supports an inexperienced person in order to enhance their skill set and allow them to advance professionally. The person may have theoretical knowledge, or at least some skills for one part of a farming operation, for example, but lacks the practical experience to be able to run things successfully on their own.

Mentorship is useful in training a person to manage a community project under the supervision of a more experienced person.
In the case of improving food security in a community, the extensionist takes the role of mentor to train and support influential community members to adopt different farming practices to improve food yields. These community members can then use this new knowledge to teach others how to implement the new systems to the point where they can independently improve their food security without the constant guidance of the extensionist.

Mentorship can be useful in empowering youth to be more proactive and participatory in improving the situations in a community. It will give them the skills they need to contribute positively to their community. Mentorship can also be a useful support system for the women in a community as it can empower them to find and gain access to opportunities where they can actively participate in making changes in their community for the better.

**The mentorship relationship**

The relationship between the mentor and the mentee is a unique one. The mentor is there in an advisory capacity and should aim to let the mentee carry out tasks and make decisions independently, but be available for guidance when it is required. The mentor has experience and expertise that they make available for the mentee to draw on when they need to. It is up to the mentee to take a proactive stance in practicing independent decision making to the point their own when the mentorship relationship ends.

**Sharing experiences and expertise**

Mentorship is a way of sharing experiences and expertise. It is important for improving retention and recruitment, building morale, accelerating leadership development, encouraging teamwork, and increasing community knowledge.
When the community is empowered to be responsible for their own development and to be confident in making decisions that will benefit the community as a whole, they will be motivated to actively improve their situation in a sustainable way. Building a community to take ownership of managing their livelihood means the extensionist can visit the community in an advisory capacity to serve their needs, rather than spending a lot of time planning and telling the community how to solve their problems. Once the community is equipped to identify their own needs, they can then independently go about solving their challenges in a way that improves their situation.

In a work setting, mentorship can fast track the professional development of young, inexperienced extensionists when the more experienced extensionists share their knowledge in a mentoring capacity.

Session 4.5: Time management

Session outcomes
After completing this session, you should be able to:
1. Discuss the benefits of effective time management; and
2. Apply time management techniques.

Introduction

Time management involves applying a set of principles, practices, and tools in order to use time wisely with the aim of improving quality of life. To be active, succeed professionally, and participate in community activities, extensionists must manage their time effectively.

Characteristics of effective time management

Time management refers to the way in which you plan and organize your time. On a larger scale, time management refers to how you organize and plan the time allocated for each task that must be completed for a plan to be implemented for effective intervention.

Characteristics of time management are:
1. Prioritizing tasks;
2. Setting targets;
3. Setting boundaries; and
4. Identifying current time management habits.

If you review your current time management habits, do they allow you to efficiently complete all your tasks in a reasonable amount of time? Are you allocating enough time for meetings and stakeholder engagements? Are you setting boundaries where you schedule set times for attending to telephone calls and written communication? Are there any tasks that you put off doing because you lack the motivation to start them?
Prioritizing tasks means that you make a list of all the things that need to be completed. You set target deadlines for each task, taking into account the realistic amount of time you will need to get things done. The more urgent the task, the higher its priority. The deadlines must be realistic and achievable, and are intended to help you manage your time better.

**Benefits of effective time management**

Managing your time effectively allows you to complete all the tasks that you need to in a way that will not put pressure on you or cause stress. When you have planned your time effectively, you will find that you are more efficient and productive in your work. When implementing a plan in a community, you will use the allocated deadlines of each activity to monitor and evaluate progress. The benefit of effective time management in this context is that the results of the action plan will appear in a reasonable time frame and funding will not be wasted on tasks that should have been completed but are running behind. Seeing results in the estimated time frame will also motivate the community to continue making the changes that you agreed on. Time allocation should take into account the time needed for the members in the community to attend to their daily or routine tasks in addition to any new activities that are implemented.

**Time management strategies**

During your work, you will be interrupted. While you cannot eliminate these interruptions, you can limit the amount of time you spend on these interruptions and how much time you will spend on the activities that make you more productive. Below are ten time management tips you can use to help you:

1. Use a schedule and record all of the things you spend your time on for one week. This will help you understand how much you can get done in a day and what your time is being spent on.
2. Make an appointment with yourself and create time blocks for high-priority tasks. Schedule when these appointments will begin and end and stick to these appointments.

3. Plan to spend at least half of your time on the tasks that produce the most of your results.

4. Plan time for interruptions or to be pulled away from what you are doing.

5. Make an appointment with yourself and create time blocks for high-priority tasks. Schedule when these appointments will begin and end and stick to these appointments.

6. Make an appointment with yourself and create time blocks for high-priority tasks. Schedule when these appointments will begin and end and stick to these appointments.

7. Put up a “Do Not Disturb” sign when you absolutely must get work done.

8. Make an appointment with yourself and create time blocks for high-priority tasks. Schedule when these appointments will begin and end and stick to these appointments.

9. Block out distractions like social media, unless they are important to your work.

10. Remember that it may not always be possible to get everything done and that it is likely that 20% of your tasks will produce 80% of your results.

Complete Activity 4.5 in your workbook.
Session 4.6: Participatory goal setting and accountability

Session outcomes
After completing this session, you should be able to:
1. Discuss the benefits of participatory goal setting;
2. Identify the characteristics of effective goals;
3. Develop an action plan to achieve a goal; and
4. Explain leader accountability.

Introduction
Participatory goal setting ensures that time, effort, and resources are being used strategically to accomplish what is important to community members. The people who will be affected by the goals should help determine them. Accountability makes sure that everyone in the community is working toward the same goals.

Benefits of setting goals
Goals give direction. To know what you want to achieve, you need to know what you expect to achieve. It is important to set a clear goal that everyone agrees on so that everyone knows exactly what they need to do to achieve this common goal.

Characteristics of effective goals
An effective goal is one that will bring about the change that is needed. It should be achievable given the available resources and one which everyone is equally committed to achieving. Table 3 shows the different goal types and their characteristics. The characteristics of an effective goal will change according to what a situation requires.
### Table 3: Characteristics of different goal types

<table>
<thead>
<tr>
<th>Goal type</th>
<th>Goal characteristic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shared</td>
<td>A goal set by a group of people who are committed to achieving it.</td>
</tr>
<tr>
<td>Measurable</td>
<td>A goal that provides a tangible point to pursue.</td>
</tr>
<tr>
<td>Challenging</td>
<td>A goal that is ambitious enough to go beyond what the community has accomplished in the past.</td>
</tr>
<tr>
<td>Achievable</td>
<td>A goal that can be accomplished with the available resources.</td>
</tr>
<tr>
<td>Time-specific</td>
<td>A goal that has a deadline or timeline.</td>
</tr>
</tbody>
</table>

### Developing an action plan

In order to develop an action plan, you need to approach it in a systematic way. Start by conducting different surveys to generate a contextual analysis of the area you are serving. Use surveys to generate a livelihood assets assessment of the community. Engage the key stakeholders of the community, as well as the community as a whole, to find out what their needs are. Identify the problems that need solutions together and then look deeper to identify the root cause of each problem. Get the community members to actively participate in coming up with possible solutions and write down all ideas. Set goals based on what they hope to achieve when implementing a solution.

Look at what and how many resources are available in the community and use this information to evaluate all possible solutions for feasibility. Use the contextual analysis to evaluate all possible solutions for acceptability then give feedback to the community and include them in choosing the best solutions for their situation.
List steps of what needs to happen for the action plan to be implemented and then prioritize tasks in order of urgency. Allocate time and set deadlines for each task to be completed. Delegate tasks to people who are skilled and capable of doing the work and provide training and mentorship where necessary. Check all the proposed changes against all the data you have collected to prevent other problems from forming as a result of the changes.

Monitor and evaluate the progress of the activities on a regular basis. If something is not happening according to the allocated time schedule, evaluate what the reasons for this might be and revise the plan.

**Importance of accountability in leadership**

Accountability in leadership means that leaders will always take responsibility for their decisions and the consequences of those decisions. A leader needs to be open and honest about their actions at all times and be willing to give feedback to any interested or affected party that asks for it.

Accountability is an important attribute in leadership because it builds a community’s trust in their leader when they are willing to openly report how they are spending resources and why they make particular decisions. If something should fail, an accountable leader will take responsibility and also a powerful motivator for a leader to act in the best interests of the community and not for their own gain, because they will have to explain their actions later. It makes sure that the leader will drive the change in the direction that will benefit their community.

Complete Activity 4.6 in your workbook.
Session 4.7: Teamwork

Session outcomes
After completing this session, you should be able to:
1. List different types of teams; and
2. Discuss the stages of team development; and
3. Apply team-building strategies.

Introduction
To accomplish most tasks in community mobilization, people must work in teams. When individuals work well together, they can do more than they could alone.

Types of teams
To accomplish most tasks in community mobilization, people must work in teams. When individuals work well together, they can do more than they could alone.

In an ideal situation, you will want all teams to be high-performing teams, but because people are all individuals with different beliefs and value systems, this will not always be possible. Being aware of the challenges that team work presents together well enough to achieve their goal.
**Stages of team development**

When working with others, there is always a process of adjustment and trust building that must happen until a group of individuals can work effectively as a team. Figure 2 shows the different stages of team development from when strangers first meet to when they become a true team.

- **Forming**
  - Team members discover each other’s behaviours.
  - Begin to set team rules and guidelines.

- **Storming**
  - The team is actively involved in determining how it will accomplish its goals.

- **Norming**
  - Team members gain confidence.
  - Begin to make decisions and take responsibility for their actions.

- **Performing**
  - The group transforms from a collection of individuals into a true team.

**Figure 2:**

**Team-building strategies**

To effectively build a team and promote good working relationships there are a few strategies that you can use. You can help group members develop familiarity and positive communication with one another by providing structured activities that promote interaction of members in a group.

It is useful to actively involve all team members in the planning meetings.
When people work together, there may be times when conflict arises. Engaging in constructive communication rather than destructive criticism can be an effective method of conflict intervention.

Complete Activity 4.7 in your workbook.
Concluding remarks

In this module, you have learned how to develop your leadership skills and that a successful leader understands the different leadership styles and knows when to apply a certain style to fit the situation. You now know that a good leader has good communication skills and understands that effective communication includes both verbal and non-verbal communication aspects. Good leaders are able to manage their time effectively and are able to motivate and inspire community co-workers. They understand the value and purpose of participatory goal setting and mentorship and are able to build teams effectively.

Complete the summative assessment in your workbook.
Study unit 5: Farmer needs assessment

Study unit outcomes
After completing this study unit, you should be able to:
1. Plan farmer needs assessments in a strategic, mission-driven manner;
2. Know the key steps when carrying out farmer needs assessment;
3. Know how to utilize results from the data collected in the farmer needs assessment.

Study unit overview
Needs assessment is a process driven by the question, “What do clients need and how can those needs be met?” (Patton, 1982). A need is defined as a gap between “what currently is” and “what should be” (Altschuld & Watkins, 2014). Needs assessment is a process to identify what people need where they live, work or play. The purpose is to use the information gained to make plans to meet those needs. What are the needs of people you serve?

Introduction
Needs assessment is a term with abundant meanings, that needs assessment was used in many cases to mean surveying clients about what they wanted, needs assessment is used to describe the entire situation in a community, county or state. “Community situational analysis” is a broad term that refers to the process of analyzing the internal and external factors (including trends, capabilities, environment analysis” is applicable to all of the techniques and activities in this module.
We believe that an effective community needs assessment would not only identify the needs of the community, but also underutilized resources, as in, “We need to utilize our lake and abundant natural beauty to promote tourism which will produce substantial economic benefits.” Therefore, we have chosen to use the term “needs assessment” as a synonym for situational analyses in this module, and the term “assets” may be used in place of needs.

Needs assessments are important for a number of reasons. Our world faces unlimited needs, but limited resources. Needs assessments help to identify areas that will do the most good for the most people over time. We live in a complex society, and it is not always clear which initiatives should be conducted or emphasized by public service organizations. Needs assessments clarify the work of public stakeholders in learning and talking about important community change over time, and a periodic assessment is necessary to understand changing needs and new situations that people face in daily life.

Session 5.1: Organization

Session outcomes
After completing this session, you should be able to:
1. How should a needs assessment be organized;
2. The phases of organizing a needs assessment.

Introduction
To organize your assessment, think about what you need to accomplish. Key action steps and considerations are outlined below using three key phases: exploration, data gathering and utilization. These phases may also be referred to as Pre Assessment, Assessment and Post Assessment.

The three phases of a needs assessment

Phase one: Exploration

 are the potential uses of the assessment information and who are the potential users of the assessment information? Identify the parameters for the assessment. Are you If you believe town mayors will be the users of the assessment information, for example, a county-wide assessment would not be valuable to them unless you break out data by town.

your parameters. More data are available today from secondary surprised at the treasure trove of information available from multiple agencies and organizations.
Third, determine if other data still need to be collected. Identify the methods to collect this information.

**Phase two: Assessment**

Collect, analyze and synthesize all of the data. Implement your needs assessment plan. Let’s say you find from the National Agricultural Statistics Service the production of cattle, hay and soybeans has been declining steadily in your county for the past five years. The rate of decline is much higher for your county than for other counties in the state. It could be helpful to determine some of the major causes or issues that have produced the declining numbers. Is it because of the weather? Is it related to land use? Is it because producers are transitioning to other enterprises? Farmers and retailers of farm equipment might be good sources of information, and they may be able to describe how and why the county’s agricultural output is changing.

**Phase three: Utilization**

Use the data to set program priorities, develop an action plan to address the needs or issues, evaluate the needs assessment, and communicate the results. A needs assessment process is not completed until the results are shared and utilized.

Complete Activity 5.1 in your workbook.
Session 5.2: Exploration

Session outcomes

After completing this session, you should be able to:
1. Know how to review document;
2. Identify different approaches of data collection.

Introduction

Reviewing existing data should be a part of any needs assessment that you conduct. Document review is the foundation for your needs assessment. These data are important for several reasons.

1. Reliable data sources provide detailed information from a large sample size that would be difficult and unrealistic for you to collect on your own.
2. Many topics are sensitive and may be difficult for people to discuss such as homelessness, bankruptcy and food insecurity.
3. Data sources can provide information over several years or decades, allowing you the opportunity to identify trends.

Questions to ask when thinking about data:
1. What information do I need? What topics do I need information about?
2. Will I be able to access county level data?
3. How current do the data need to be? What’s my cut-off date?

The document review is often a helpful starting point for a comprehensive needs assessment. It can help you to identify what is known and pinpoint what you still want to know. Document reviews tend to be helpful especially when used with individual and/or group methods. This process provides a sense of both what is happening and why it may be happening.

Complete Activity 5.2 in your workbook.
Session 5.3: Assessment

Session outcomes
After completing this session, you should be able to:
1. What is a needs assessment; and
2. Know key informants when conducting an assessment.

Introduction
A needs assessment is essentially an investigation, and information is provided by individuals or a group of respondents.

Key informant
A key informant is an individual who provides important information. An assessment of the health status of the community would be accentuated greatly by seeking the opinions of nursing home administrators, dementia caregivers, doctors and coordinated school health directors, just to name a few examples of key informants.

Key informants are often very helpful to add color or additional information to a needs assessment. They tend to be knowledgeable and may provide distinct information. They can help you understand why something is happening or understand the history of community attributes. It is not recommended to use key informants solely for an entire needs assessment because it could place too much importance on the opinions of a handful of individuals.

Personal Interviews
Personal interviews are useful in conducting needs assessments.
Preparation is extremely important because interviews can be challenging if you ask about highly personal topics. Interviews mainly provide qualitative data, such as perceptions, values, opinions, and information from personal observation (Witkin & Altschuld, 1995) in contrast to quantitative data (quantities, amounts, percentages, proportions, facts, etc.).

Conducting the Interview

Prepare your questions in advance and practice them so that you are well-prepared. When conducting an interview, you should be dressed in either business attire or in similar attire as the interviewee. If you do not understand an answer, be honest and ask the interviewee to clarify for you. Start a personal interview by making small talk to make the person feel comfortable (Vilela, 2014).

Interview Protocol

When conducting the interview, ask few questions and resist offering advice (Creswell, 1998). An interview procedure is recommended. A written procedure helps you to stay on task and on time.

Here is an example interview procedure:

Step 1: If recording, test equipment in the office the day before the interview. Purchase any needed supplies (i.e., batteries for the recorder).

Step 2: Travel to the interview site.

Step 3: Engage in small talk to put the interviewee at ease.

Step 4: Inform the interviewee of the purpose of the interview.

Step 5: If recording, get the interviewee’s verbal permission to tape record.
**Step 7:** Ask if the interviewee is ready for you to begin recording.

**Step 8:** Record the following information either verbally or in your notes:
- Date
- Time
- Location
- Participant pseudonym
- Interviewer’s name

**Step 9:**

**Step 10:** Watch the time and do not go over time.

**Step 11:** Thank the interviewee for participating.

**Step 12:**

**Step 13:**

**Timing and Length**

Timing is important for all interviews and should be considered before contacting potential interviewees. Is there a certain day of the week or time of day that the person is likely available? If you are interviewing fast-food managers about food safety training needs of their employees, the lunch hour is the worst possible time to call on them for an interview. The afternoon, say 2 p.m., might be much better.

When you contact the interviewee to invite them to participate in an interview, it’s important to know how long the interview will last. Practicing questions in advance and thinking through possible answers can help you gain a sense of how long the
interview will take. A useful step is to interview friends, family or coworkers to help determine the approximate length of the interview process, and to identify any questions that are unclear. To be considerate of people’s time and attention spans, ideally the interview should not last more than 30 minutes.

Focus Groups

Focus groups are planned discussions to capture perceptions from a select group of people. Focus groups have multiple uses including needs assessment, program development, evaluation and breadth of information while helping to build relationships with clients (Martens, 2010). The ideal size of a focus group is seven to 10 people (Kreuger, 1988; Krueger & Casey, 2009; Smithson, 2008). The focus group moderator is critically important because the group discussion is many times reflective of his/her skills and values.

Why Focus Groups?

Focus groups have many characteristics that make them well-suited for Extension work including the needs assessment process. First, focus groups tend to lend themselves to open-ended questions. These questions are helpful for thinking about complex problems and programs. The information gained from focus groups can help address problems at the program design stage.

- You need visual aids
- You ask sensitive questions
- You need a group to develop ideas
- Interaction and “building on ideas” will provide useful information
- One person shares and it triggers a memory for someone else.
Time to collect information is limited
People get along

**Participant Selection**

- Consider seven to 10 people for a single session. Consider those who would be comfortable with one another, but do not necessarily know one another. Consider diversity in gender, race/ethnicity, residence and other areas to offer rich perspectives.
- Plan two to three focus group sessions with different people. This provides you with a greater cross-section of your clients and allows you to see patterns across the groups.
- Consider selecting participants who have a similar association to the topic being discussed. As an illustration, if you are assessing infant and child nutrition, select participants who are all parents. Another group might be all elected officials.

**Analyze your data**

One disadvantage of focus groups is that the data can be challenging to analyze as compared to questionnaires (Martens, 2010). In general terms, you can analyze your data by doing these two tasks:

1. Identify common responses within each focus group; these are referred to as common themes.
2. Compare and contrast themes across the different focus groups.

Complete Activity 5.3 in your workbook.
Session 5.4: Utilization

Session outcomes
After completing this session, you should be able to:
1. The difference between quantitative and qualitative data; and
2. How to interpret data.

Introduction

Needs assessment should be a multitiered approach — one source of information is not going to provide a comprehensive understanding of an issue or your county. When looking at data from different sources, it is important to make sure you have different types of information — both quantitative (hard numbers and percentages) and qualitative (open-ended comments, focus group and other group discussion). For each method, there is an appropriate way to interpret data.

Quantitative data

For quantitative data, it is important to start with a description. If you conducted a survey, answer the following questions:
1. How many people received the survey?
2. Was this a specific group of people (for example, TNCEP coalition members, agriculture producers or teachers) or was the survey sent to a sample from the community?
3. How many people responded?
4. Describe the respondents by gender, race/ethnicity, age, location.

1RZORRNDWWKDFWXDOqGLQJV&DOFXODWHWKHoQGLQJVIRU each question either as a percentage or mean based upon the
Module 8: Community mobilization and farmer needs assessment

Look for similarities and differences. Think about your expectations. Do the findings agree with or contradict what you thought would happen? Do the findings agree with the information that you found during the document review?

Qualitative data

1. How many people were invited to participate (specifically for the focus group or advisory committee meetings)?
2. How many people attended?
3. How many people actively participated in the process? (This number would represent the amount of people who spoke)
4. If applicable, describe the respondents by gender, race/ethnicity, age, location.

Response categories and subcategories. Look for trends and patterns in the data. Coding is one technique to organize the group with parents of young children, "day care" could be other codes as you read through the data. Look for ideas and words that are mentioned frequently. Using the "picky eaters" or "potty-training." As you examine the
Putting the Findings Together

Once you have looked at the findings separately by method, it is time to put the results together. Now look for similarities and differences. What were the major findings from each method? Are these findings similar or were there differences?

It is possible some findings contradict other findings. For example, a document review could identify bankruptcy as a major issue for your county. However, you conducted several focus groups, and focus group members did not feel bankruptcy was important. They did not see a need for programming for this issue. Your Advisory Committee also felt that overall resource management specifically relating to spending food dollars wisely was more important. It is important to keep in mind that some issues are sensitive and might not emerge from focus groups or open listening sessions. People might react more positively to programs that deal with issues from a broader standpoint rather than bankruptcy class. The sections on setting priorities provide tips for dealing with needs assessments that include contradictory findings.

Because needs assessments take time and resources, it is important to share results with others in the community. Key stakeholders who have an interest in community issues should be informed through meetings and reports. Reports are helpful because you can articulate the needs in the community as well as demonstrate ways Extension can help meet those needs. Newsletters and media reports can reach a broader audience and can help you promote Extension because you can explain your involvement with the community as well as inform the community about programs to address those needs.
Module 8: Community mobilization and farmer needs assessment

Numbers and statements work together well. Numbers tell what is going on, but statements can illustrate those numbers.

* Complete Activity 5.4 in your workbook.
Concluding remarks

Needs assessment is important because it helps an organization determine the gaps that are preventing it from reaching its desired goals. In A Guide to Performing a Needs Assessment and a Gap Analysis, these gaps can exist in either knowledge, practices, or skills.

There are different approaches that can be used when planning for a farmer needs assessment. You will need to always adapt your assessment with the intended results.

A good needs assessment combines discussion and field observation to identify the actual problems facing farmers, the “true cause” of those problems and possible solutions based on discussion with farmers, researchers and extension workers. Recommendations are discussed and developed with farmers based on the farmers’ resources and circumstances.

- Complete the summative assessment in your workbook.

- Complete the post-assessment in your workbook.

Global Forum for Rural Advisory Services (GFRAS) is about enhancing the performance of advisory services so that they can better serve farm families and rural producers, thus contributing to improved livelihoods in rural areas and the sustainable reduction of hunger and poverty. Rural advisory services help to empower farmers and better integrate them in systems of agricultural innovation.
